# Java template

```
import java.io.*;
import java.util.*;
public class Main
    public static void main(String[] args)
        MyScanner sc = new MyScanner();
        out = new PrintWriter(new BufferedOutputStream(System.out));
        // Start writing your solution here.
        // Stop writing your solution here.
        out.close();
    public static PrintWriter out;
    public static class MyScanner
```

```
BufferedReader br;
StringTokenizer st;
public MyScanner()
    br = new BufferedReader(new InputStreamReader(System.in));
boolean hasNext()
    while (st == null || !st.hasMoreElements()) {
            st = new StringTokenizer(br.readLine());
        } catch (Exception e) {
            return false;
    return true;
String next()
    if (hasNext())
        return st.nextToken();
    return null;
int nextInt()
    return Integer.parseInt(next());
long nextLong()
    return Long.parseLong(next());
double nextDouble()
    return Double.parseDouble(next());
String nextLine()
    String str = "";
    try {
        str = br.readLine();
    } catch (IOException e) {
        e.printStackTrace();
    return str;
```

#### 1.2.1 Java Issues

- 1. Random Shuffle before sorting: Random rnd = new Random(); rnd.nextInt();
- 2. Use StringBuilder for large output
- 3. For class sorting, use code implements Comparable<Class name>. Or, use code new Comparator<Interval>() {} atCollections.sort() | N

second argument

# 2 System Testing

- 1. Test g++ (-Wall -Wextra -Wshadow -std=c++11) and Java 8 compiler
- 2. Test if c++ and Java templates work properly on local and judge machine (bits/stdc++.h, auto)
- 3. Test "divide by  $0" \rightarrow RE/TLE$ ?
- 4. Make a complete graph and run Floyd warshall, to test time complexity of the judge machine

# 3 Reminder

- 1. 請不要排擠隊友!要記得心平氣和的小聲討論喔! 通常隊友的建議都會突破 你盲點。
- 2. 每一題都要小心讀, 尤其是 IO 的格式和限制都要看清楚。
- 3. 小心估計時間複雜度和 空間複雜度
- 4. Coding 要兩人一組,要相信你隊友的實力!
- 5. 1WA 罰 20 分鐘! 放輕鬆,不要急,多產幾組測資後再丢。
- 6. 範測一定要過! 產個幾組極端測資,例如 input 下限、特殊 cases 0, 1, -1、 $z_3^2$  集合等等
- 7. 比賽是連續測資,一定要全部讀完再開始 solve 喔!
- 8. Bus error: 有scanf, fgets 但是卻沒東西可以讀取了! 可能有 early termi- nation 但是時機不對。
- 9. 圖論一定要記得檢查連通性。最簡單的做法就是 loop 過所有的點
- 10. long long = int \* int 會完蛋
- 11. long long int 的位元運算要記得用 1LL << 35
- 12. 記得清理 Global variable (煒杰要記得清圖喔!)
- 13. 建圖時要注意有無重邊!
- 14. c++ priority queue  $\not\equiv$  max heap, Java  $\not\equiv$  Min heap
- 15. 注意要不要建立反向圖

# 4 Topic list

- 1. 列舉、窮舉 enumeration
- 2. 貪心 greedy
- 3. 排序 sorting, topological sort
- 4. 二分搜 binary search (數學算式移項合併後查詢)
- 5. 爬行法(右跑左追)Two Pointer
- 6. 離散化
- 7. Dynamic programming, 矩陣快速冪
- 8. 鴿籠原理 Pigeonhole
- 9. 最近共同祖先 LCA (倍增法, LCA 轉 RMQ)
- 10. 折半完全列舉 (能用 vector 就用 vector)

- 11. 離線查詢 Offline (DFS, LCA)
- 12. 圖的連通性 Directed graph connectivity -> DFS. Undirected graph -> Union Find
- 13. 因式分解
- 14. 從答案推回來
- 15. 寫出數學式,有時就馬上出現答案了!
- 16. 奇偶性質
- 17. 串接、反轉、兩倍長度

# 5 Useful code

# 5.1 Leap year O(1)

```
(year % 400 == 0 || (year % 4 == 0 && year % 100 != 0))
```

# **5.2** Fast Exponentiation O(log(exp))

Fermat's little theorem: 若 p 是質數,則  $a^{p-1} \equiv 1 \pmod{p}$ 

# **5.3** Mod Inverse O(log n)

```
Case 1: gcd(a, m) = 1: ax + my = gcd(a, m) = 1 (use ext_gcd)
```

Case 2: p is prime:  $a^{p-2} \equiv a^{-1} mod p$ 

# **5.4 GCD** O(log(min(a+b)))

注意負數的 case! C++ 是看被除數決定正負號的。

```
ll gcd(ll a, ll b)
{
    return b == 0 ? a : gcd(b, a % b);
}
```

# **5.5** Extended Euclidean Algorithm GCD O(log(min(a + b)))

Bezout identity ax + by = gcd(a, b), where  $|x| \le \frac{b}{d}$  and  $|y| \le \frac{a}{d}$ .

```
ll extgcd(ll a, ll b, ll& x, ll&y) {
       if(b = 0) {
           x = 1;
           y = 0;
           return a;
5
       }
6
       else {
           ll d = extgcd(b, a \% b, y, x);
9
           y = (a / b) * x;
           return d;
10
11
12
```

# **5.6** Prime Generator O(nloglogn)

## 5.7 C++ Reference

```

# 6 Search

# **6.1** Ternary Search O(nlogn)

```
double l = ..., r = ...; // input
for(int i = 0; i < 100; i++) {
    double m1 = l + (r - l) / 3, m2 = r - (r - l) / 3;
    if (f (m1) < f (m2)) // f - convex function
        l = m1;
    else
        r = m2;
}
f(r) - maximum of function</pre>
```

## 7 Basic data structure

## 7.1 1D BIT

```
// BIT is 1-based
   const int MAX_N = 20000; //這個記得改!
   ll bit[MAX N + 1];
   ll sum(int i) {
       int s = 0;
       while (i > 0) {
            s += bit[i]:
            i = (i \& -i);
       }
10
11
       return s;
12
13
   void add(int i, ll x) {
14
       while (i <= MAX_N) {
15
            bit[i] += x;
16
            i += (i \& -i);
17
18
19
```

 $^{\circ}$ 

#### 7.2 2D BIT

```
1 // BIT is 1-based
   const int MAX_N = 20000, MAX_M = 20000; //這個記得改!
   ll bit[MAX_N + 1][MAX_M + 1];
   ll sum(int a, int b) {
       ll s = 0;
       for (int i = a; i > 0; i = (i \& -i))
            for (int j = b; j > 0; j = (j \& -j))
8
               s += bit[i][j];
9
10
           return s;
   }
11
12
   void add(int a, int b, ll x) {
13
14
       // MAX N, MAX M 須適時調整!
       for (int i = a; i \le MAX_N; i += (i \& -i))
15
16
           for (int j = b; j \le MAX_M; j += (j \& -j))
                bit[i][i] += x;
17
18 | }
```

#### 7.3 Union Find

```
const int MAX_N = 20000; // 記得改
   struct UFDS {
       int par[MAX_N];
       void init(int n) {
           memset(par, -1, sizeof(int) * n);
       }
       int root(int x) {
           return par[x] < 0 ? x : par[x] = root(par[x]);
       void merge(int x, int y) {
           x = root(x);
15
           y = root(y);
           if (x != y) {
17
               if (par[x] > par[y])
18
                swap(x, y);
                par[x] += par[y];
20
               par[y] = x;
21
           }
22
23
   };
24
```

# 7.4 Segment Tree

```
ll dflt:
                              // default val
       ll seg[2 * MAX NN]: // 0-based index, 2 * MAX NN - 1 in fact
8
       ll lazy[2 * MAX_NN]; // 0-based index, 2 * MAX_NN - 1 in fact
       // lazy[u] != 0 <->
10
       // substree of u (u not inclued) is not up-to-date (it's dirty)
11
12
       void init(int n, ll val)
13
14
            dflt = val;
15
            NN = 1;
16
            while (NN < n)
17
                NN <<= 1;
18
            fill(seg, seg + 2 * NN, dflt);

```

# 9.3 BCC

一張無向圖上,不會產生關節點 (articulation point) 的連通分量,稱作「雙連通分量」(Biconnected Component)。

一張無向圖上,不會產生橋 (bridge) 的連通分量,稱作「橋連通分量」(Bridge-connected Component)。

## 9.3.1 Biconnected Component

以 Edge 做分界的話, stack 要装入 (u - v), 並 pop 終止條件為!= (u - v) 以 Articulation point 做為分界 (code below), 注意有無坑人的重邊

用 SCC 的 code 的話,只要多判一個 u 是否為 p,如果是的話就直接 return (加在第 21 行之後)

## 9.3.2 Bridge-connected Component

```
const int MAX_N = 5555;
vector<int> g[MAX_N];
int tt, dfn[MAX_N], low[MAX_N];
int bcc;
```

```
int belong[MAX_N]; // 縮點用
                                                                                     20

  9.4 SCC
```

First of all we run DFS on the graph and sort the vertices in decreasing of their finishing time (we can use a stack).

Then, we start from the vertex with the greatest finishing time, and for each vertex<sup>53</sup> v that is not yet in any SCC, do: for each u that v is reachable by u and u is not yet<sup>54</sup> in any SCC, put it in the SCC of vertex v. The code is quite simple.

```
const int MAX_V = ...;
   const int INF = 0x3f3f3f3f;
   int V:
   vector<int> g[MAX_V];
   int dfn_idx = 0;
   int scc_cnt = 0;
   int dfn[MAX V];
   int low[MAX V];
   int belong[MAX_V];
   bool in_st[MAX_V];
11
   vector<int> st;
12
13
   void scc(int v)
14
15
   {
        dfn[v] = low[v] = dfn_idx++;
16
        st.push_back(v);
17
       in_st[v] = true;
18
19
```

```
for (int i = 0; i < int(q[v].size()); i++) {
        const int u = q[v][i];
        if (dfn[u] == -1) {
            scc(u);
            low[v] = min(low[v], low[u]);
        } else if (in_st[u]) {
            low[v] = min(low[v], dfn[u]);
   }
   if (dfn[v] = low[v]) {
       int k:
        do {
            k = st.back();
            st.pop_back();
            in st[k] = false;
           belong[k] = scc_cnt;
       } while (k != v);
        scc_cnt++;
   }
}
void tarjan() // scc 建立的順序即為反向的拓璞排序
    st.clear();
    fill(dfn, dfn + V, -1);
    fill(low, low + V, INF);
   dfn_idx = 0;
    scc cnt = 0:
    for (int v = 0; v < V; v++) {
       if (dfn[v] == -1) {
            scc(v);
   }
```

44

45

46

47

55

```
for(int k = 0; k < N; k++)
    for(int i = 0; i < N; i++)
       for(int j = 0; j < N; j++)
            dp[i][j] = min(dp[i][j], dp[i][k] + dp[k][j]);
```

#### 9.6 MST

#### 9.6.1 Kruskal

- 1. Store the graph by (weight, (from, to))
- 2. Sort the graph by weight
- 3. Start from the smallest weight, and keep adding edges that won't form a cycle so with the current MST set
- 4. Early termination condition: n-1 edges has been added, NOT size of the s union-find set

#### 9.6.2 Second MST

## 14.7 2-Circle relations

```
d = 圓心距, R, r 為半徑 (R \ge r) 內切: d = R - r 外切: d = R + r 內離: d < R - r
```

外離: d > R + r相交: d < R + r 且 d > R - r

#### 14.8 Fun Facts

1. 如果  $\frac{b}{a}$  是最簡分數,則  $1-\frac{b}{a}$  也是

## 14.9 偏序集與 Dilworth

#### 14.9.1 原理

Dilworth 與其對偶定理適用於嚴格偏序,也適用於非嚴格偏序。(Hasse Diagram)

1. Dilworth: 最小正鏈覆蓋=最長反鏈長度

2. 對偶定理: 最小反鏈覆蓋 = 最長正鏈長度

#### 14.9.2 題目

R x C 的格子中 N 個點 (r[i], c[i])。 定義一次旅行為從任一個點出發, 只能 **往右走或往下走**。 請問:

1. 經過最多點的那次旅行是經過了多少個點?

2. 最少須要旅行幾次才能走完所有點?

即非嚴格偏序集  $P = (S, \leq)$ 

$$\begin{cases} S &= \{(r_i, c_i) | 0 \le i < N\} \\ \le &= (r_i \le r_j \land c_i \le c_j) \end{cases}$$

$$\tag{3}$$

題目所求分別為

1. 最長正鏈長度, 即為最小反鏈覆蓋。

2. 最小正鏈覆蓋,即為最長反鏈長度。

# 14.9.3 只能往右走或往下走

## 最長正鏈長度

1. 將點排序, r 由小到大, 相同時 c 由小到大

2. 在 C 上求最長 單調遞增子序列,長度即為所求

## 最長反鏈長度

1. 將點排序, r 由小到大, 相同時 c 由小到大

2. 在 C 上求最長 嚴格遞減子序列,長度即為所求

如果題目改成 只能往斜右下走,不能向右或向下,則演算法改成

#### 最長正鏈長度

- 1. 將點排序, r 由小到大, 相同時 c 由大到小
- 2. 在 C 上求最長 嚴格遞增子序列,長度即為所求

#### 最長反鏈長度

for 2017 NCPC (Built on: October 20, 2017)

- 1. 將點排序, r 由小到大, 相同時 c 由大到小
- 2. 在 C 上求最長 單調遞減子序列,長度即為所求
- c 由小到大是為了防止誤判

#### 14.9.5 最長嚴格遞增子序列、最長嚴格遞減子序列

```
_{1} | const int INF = 0x3f3f3f3f3f:
int lsis(const vector<int>& v) {
      vector<int> dp(sz(v), INF);
       for (auto x : v) {
           *lower_bound(dp.begin(), dp.end(), x) = x;
       return find(dp.begin(), dp.end(), INF) - dp.begin();
  int lsds(const vector<int>& v) {
       vector<int> rv = v;
       reverse(rv.begin(), rv.end());
       return lsis(rv);
```

## 14.9.6 最長單調遞增子序列、最長單調遞減子序列:

```
const int INF = 0x3f3f3f3f;
   int lmis(const vector<int>& v) {
       vector<int> dp(sz(v), INF);
       for (auto x : v) {
            *upper_bound(dp.begin(), dp.end(), x) = x;
       return find(dp.begin(), dp.end(), INF) - dp.begin();
   int lmds(const vector<int>& v) {
       vector<int> rv = v;
        reverse(rv.begin(), rv.end());
        return lmis(rv);
12
13 | }
```

#### 14.10 排列組合

#### 14.10.1 排列 P

$$P_k^n = \frac{n!}{(n-k)!}$$

- 1. 從 n 個不同球中取 k 個,不同取出順序視為不同,方法數為  $P_n^n$
- **2**.  $P_2^4 = 12$

#### 14.10.2 圓排列 Q

$$Q_k^n = \frac{n!}{k(n-k)!} = \frac{P_k^n}{k}$$

- 1. 從n 個不同球中取k 個,排成一個圓,圓只考慮相對位置,方法數為 $Q_n^n$
- 2.  $Q_2^4 = 6$

#### 14.10.3 組合 C

$$\begin{cases} C_n^n &= C_0^n = 1\\ C_k^n &= C_{n-k}^n = \frac{n!}{(n-k)!k!} = \frac{P_k^n}{k!}\\ C_k^n &= C_{k-1}^{n-1} + C_k^{n-1} \end{cases}$$
(4)

- 1. 從 n 個不同球中取 k 個, 取出順序不影響, 方法數為  $C_k^n$
- 2. 考慮第k 顆球取或不取: 取的話轉移成從n-1個不同球中取出k-1個; 不 取的話,轉移成從 n-1 個球中取 k 個,即  $C_k^n = C_{k-1}^{n-1} + C_k^{n-1}$
- 3.  $C_2^4 = 6$

## 14.10.4 重複組合 H

$$H_k^n = C_k^{n+k-1} = C_{n-1}^{n+k-1}$$

- 1.  $\mu_n$  期相同的球丢進  $\mu_n$  個可空、不同箱子,方法數為  $\mu_n$
- **2.**  $x_1 + x_2 + \cdots + x_n = k$ ,  $(x_1, x_2, \dots, x_n)$  非負整數解的個數為  $H_k^n$
- 3.  $x_1 + x_2 + \cdots + x_n = k$ ,  $(x_1, x_2, \dots, x_n)$  正整數解的個數為  $H_{k-n}^n$
- 4.  $H_2^4 = 10$

## 14.10.5 Stirling Number (Type I)

$$\begin{cases}
S_1^n = 0 \\
S_1^n = 1 \\
S_k^n = S_{k-1}^{n-1} + (n-1)S_k^{n-1}
\end{cases}$$
(5)

- 2. 考慮第n 顆球:可以自己一個箱子,即其他n-1 個球丟進k-1 個箱 子;也可以n-1 個球丟進k 個箱子,這顆球插到任一顆球旁邊。所以得  $S_k^n = S_{k-1}^{n-1} + (n-1)S_k^{n-1}$ 3.  $S_2^4 = 11$

#### 14.10.6 Stirling Number (Type II)

$$\begin{cases} S_n^n &= S_1^n = 1\\ S_k^n &= S_{k-1}^{n-1} + k S_k^{n-1} \end{cases}$$
 (6)

- 為  $S_{k}^{n}$
- 2. 考慮第n 顆球:可以自己一個箱子,即其他n-1 個球丟進k-1 個箱 子; 也可以n-1 個球丟進 k 個箱子, 這顆球丟進其中一個箱子。所以得  $S_k^n = S_{k-1}^{n-1} + k S_k^{n-1}$ 3.  $S_2^4 = 7$
